

DAY-2 TASK REPORT

RAG :-

“RAG is an AI model that retrieves relevant information from the knowledge”

Do's of RAG :-

- Use high quality data sources , stores accurate and remove outdated and incorrect information.
- Keep data well organised that structure documents properly ,use clear headings , sections and etc,.
- Retrieve only the relevant information which plays key role.
- Update the knowledge base regularly by adding new data frequently.
- It uses semantic search which means search based on info not just keywords.

Don'ts of RAG :-

- Don't use low- quality data that means avoid incorrect ,outdated or unverified documents.
- Don't ignore data updates ,keep information current.
- Don't store duplicate documents which leads to redundancy and inconsistent responses.
- Don't use large and small chunks ,large chunks may contain irrelevant info and small chunks may lose imp content.
- Don't trust retrieved info blindly this may lead to incorrect responses.

Limitation of RAG :-

- Depends on retrieval quality ,wrong retrieval gives wrong answer .
- Knowledge base must be updated .
- Context length limitations, Important information may be excluded if too much data is retrieved.
- RAG system has complex setup.
- Documents are split into chunks ,poor chunks leads to lose context,reduce answer quality.
